A: Linux if you want to program your own application under Linux, you can learn about the programming language C. In linux, you will use the C compiler which is called "gcc". C uses the C++ programming language and it is a much more advanced language. Therefore, when you program in C, you have to learn about C++ before you can use C. And, as said before, the C++ programming language is a better programming language than C. But C has its own advantages. C C is usually the first programming language the kids learn. When you start learning C, you are taught how to work with strings, numbers, and how to execute commands. String A string is a string of characters. You can edit them and rewrite them as you like. To work with a string, you should create a new one of that type and add your characters to that string: `string line = "Welcome to Linux"; char* s = new char[line.length()+1]; strcpy(s, line.c_str());` You can print it with the function `std::cout: std::cout << 255 << endl; string l = line.substr(0, 255); line = l + " ";` Characters Characters are like the individual dots on a keyboard. You can use the function `std::getchar()` or `scanf()` to read in a character. Numbers To work with numbers, you should use the class `std::intmax_t`. These are an integer type, much like the type `int` in C++. `int max = std::intmax_t(1) * std::intmax_t(2);` Execution Commands When you have finished with the strings and numbers, you can execute a command: `system("echo " + s);` In the system command you can give the command you want to execute as a string. Otherwise, you can also execute commands directly: `//Execute the following command with argv: system("ls " + argv[0]); //Execute the following command without argv: system("ls");` The system

Answer: No, not currently. They are working on an upcoming update that will probably be an incremental update that will improve their existing features. Don't worry about it, it's not a big issue.

Q: How to get file size as variable in batch script? I need to know the size of a file as a variable, so I can pass that variable to another windows command. How do I do this? I've tried getting the size of the file like so (these are just made up names): SET FILE_SIZE= FOR %%a IN (%) DO (SET FILE_SIZE=%%a) The problem here is that when I run the script, the %FILE_SIZE% doesn't equal the file size in bytes. Any help would be appreciated.

A: IF you have the SYSTEM variable then you can use this: set "SIZE=%SYSTEM:-1%bytes" you can then replace the value of "SIZE" in your script with this: set "SIZE=%SIZE:-0,-1%" The SYSTEM environment variable is a good choice since it is a standard variable. If you don't have the SYSTEM variable then you have to use for /f, as with the other solutions given.

Edit: To determine the size of a file from an input parameter, use this: set "SIZE=0" FOR /F "delims=%%a IN ('ECHO %1') DO SET /A "SIZE=%%a" Edit 2: From your comment, it sounds like what you want is to change the file size with some form of loop. A simple one-liner: FOR /L %%a IN (1,1,%SIZE%) DO ECHO %%a This will use the variable value as the loop iteration. A better, possibly more efficient approach would be to use the SETLOCAL EnableDelayedExpansion flag. This allows you to write code like this: FOR /L %%a IN (1,1,!SIZE!) DO ECHO %%a The! variable is expanded when the loop executes and you can use it to set the value of your loop variable, e.g., as in the above example. If you want to try a more complex solution, you can use the SET /A command to loop over a range. See 3e33713323
