Nivolumab is a human IgG4-type monoclonal antibody that acts by blocking programmed cell death protein-1 (PD-1) or

its ligand, PD-L1. Hyponatremia is a rare adverse event associated with PD-1/PD-L1 antibody therapy. Hyponatremia associated with PD-1/PD-L1 therapy is generally mild and transient. In this report we describe a case of a patient with advanced renal cell carcinoma who experienced life-threatening spontaneous colitis and nivolumab-induced hyponatremia associated with prolonged hospitalization. This is the first report of a patient experiencing both spontaneous colitis and hyponatremia during nivolumab therapy. Clinicians must be cautious when administering anti-PD-1/PD-L1 therapy in patients with underlying cancer to avoid life-threatening adverse events. Q: How to do something after

request to server for each element in list, in React-Native? I have a list (that is a with numberOfChildren=3) and I need to do something after a request is made for each of the items in the list. What I want to do is make a request to a server after the request for each item in the list.

Something like this

```
this.props.layers.map(requestItem =>
  requestItem()); // after that I do something
I found the useCallback() function but it
would only work if I had many elements in
the list and onPress={() => {}} would be
attached to the element of the list,
```
