In this study, three patients with splenic artery aneurysm treated at our institute during the last 4 years were evaluated. Aneurysm was detected as a result of nonspecific abdominal pain in all three patients. In two of the cases the aneurysm was located in the distal splenic artery, whereas the third one was a case of a type II (segmental) aneurysm located in the proximal splenic artery. Spontaneous rupture occurred in two of the patients. The third patient was treated conservatively. In our series, conservative treatment led to the absence of clinical and pathological complications. We suggest a conservative approach in carefully selected patients with asymptomatic splenic artery aneurysms that are smaller than 2 cm in diameter. Effect of Peripheral Oxygen Tension on Angiogenesis. In vitro and in vivo angiogenic responses can be modulated by altering the concentrations of oxygen, one of the key factors regulating cell metabolism and function. It is hypothesized that the oxygen tension in the cellular microenvironment at the time of angiogenesis plays a significant role in the angiogenic and vascular organization processes by affecting vascular growth and branching. In the current study, the effect of tissue-equivalent low oxygen tension (7% O₂, 5% CO₂, 88% N₂) was evaluated on the vascular and developmental growth of embryonic zebrafish, and alterations in the vascular organization of the embryos were assessed. The expression levels of vascular endothelial growth factor (VEGF) and angiotensin-2 (Ang-2) were measured using immunohistochemistry and Western blotting. The level of apoptosis was assessed using TUNEL assay. The results showed that the main differences between the animals exposed to hypoxia and normoxia were in the number of angiogenic sprouts from the intersegmental vessels and in the vascular arrangement within the trunk of the embryo. It was observed that in the control normoxic embryos, blood vessels developed with a uniform degree of branching along the dorsal aorta. In
