You can capture a photo from a smartphone (or tablet) and use it in the program. Elements also lets you share a photo on social media platforms, including photo-sharing websites like Facebook, Instagram, Flickr, Behance and Picassa. You can also share it on the Web using the built-in Web Gallery or Adobe URL tools. And it can export images in a variety of formats, including JPG, PNG and GIF, for use on websites and social media platforms. Lightroom 5's default catalog size has been increased from 10 Gigabytes to 15 Gigabytes, where Photoshop CS can be managed at 20 Gigabytes, and the catalog will be adjusted slightly to fit ten more Photo Library images. Larger catalogs may be fine, but your average user may feel that the minimum size is too small, especially when using a 32 GB computer. I only recently had to move my Lightroom 5 catalog to a larger drive to accommodate anticipated future growth and my experience was that the Lightroom 5 catalog increased its size by approximately 70% (pre 5.0 to post 5.0), which is not bad at all. I am still happy with the general performance of the Lightroom 5 catalog. The initial import takes about as long as for Lightroom 4, but importing a project/catalog after the initial import is now about twice as fast. Given that, I am willing to put up with some additional time for Lightroom 5 to import the images that I want to include in a new project. The new Window Options menu feature allows you to quickly change the size and position of your Lightroom window anywhere on the screen, even if it is not the current active window. The new Express Merge function is included with Lightroom 5. Selectively merge multiple images to a new one with the same tools you've used on the original images. One click Merge will merge them all in and one click Undo Merge will undo all of those changes. This is very useful if you are correcting an image and end up switching tools on half of the images you want to join later. Lightroom 5 lets you share project web pages with potential clients that make it easier

to visually compare projects in your portfolio in fewer steps.

In the past, users could import their files into Photoshop and print them out using the Print function on the File menu. However, it was essential to have any embedded device capable of supporting PostScript at the time of the export: this is no longer required after the change to native APIs, so the printing support in Photoshop is now enabled by default. In earlier versions of Photoshop, Adobe introduced Photoshop's live filters, which allowed users to apply a filter without being attached to any layers, or modify a filter's settings using the Common Controls. These features were unreliable and Adobe has replaced them with the Fluid Canvas Filter function. This new native API is dedicated to GPU workflows. It is possible to use multiple GPUs with Photoshop, and the best one is automatically detected. Image and Mask Warp work will be more stable on the new native APIs. In earlier versions of Photoshop, users created a TIFF file and then opened it in Photoshop via the File > Open dialogs. Now, Photoshop will open files directly in the workflow on a consistent API. In earlier versions of Photoshop, users from different operating systems could share files via the File > Share dialog. This utility has been replaced with the ability to share files in the Photoshop organization or Save As dialog. PC users have long been able to rotate images inside the Photoshop application, using the Rotate Tools in the Tools menu. With the upcoming switch to native APIs, we have consolidated this functionality to a single rotate tool in the Image menu and auto-detected GPU

capabilities, so it can now be used to enable various best practices for 2D workflow optimization.
